# Knowledge Organiser 

Year 9 Computer Science

## Logic Gates

## NOT

If $A$ is True then the output is False, if the input $A$ is False then the output is True.

| A | Output |
| :---: | :---: |
| 1 | 0 |
| 0 | 1 |

## AND

If both $A$ and $B$ are True then the output is also True, otherwise it is

False.

| A | B | Output |
| :---: | :---: | :---: |
| 0 | 0 | 0 |
| 0 | 1 | 0 |
| 1 | 0 | 0 |
| 1 | 1 | 1 |

## OR

If either or both A, B are True then the output is also True.

| A | B | Output |
| :---: | :---: | :---: |
| 0 | 0 | 0 |
| 0 | 1 | 1 |
| 1 | 0 | 1 |
| 1 | 1 | 1 |

## Boolean Operators and Mathematical Symbols

- equal to ( $\mathrm{a}==\mathrm{b}$ )
- not equal to (a $!=b$ )
- less than (a<b)
- greater than $(a>b)$
-     + (add)
-     - (subtract)
-     * (multiply)
- /(divide)

## Converting Binary to Denary

1. Write the binary place values in their columns

$$
\begin{aligned}
& \text { Yes }=1 \\
& \text { No }=0
\end{aligned}
$$

|  | 128's | 64's | 32's | 16's | 8's | 4's | 2's | 1's |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 10 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 |
|  |  |  |  |  |  |  |  |  |
| 2. Is the denary value $>=$ ? |  | 3. If Yes - subtract the binary place value from the value |  |  |  |  | Is the denary value $>=$ ? |  | value from the value

## Converting Binary to Decimal

Write the binary number under the place values and then add together all of the values that have a 1 underneath them.

| 128 | 64 | 32 | 16 | $\mathbf{8}$ | 4 | 2 | 1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{0}$ | $\mathbf{0}$ | $\mathbf{0}$ | $\mathbf{1}$ | $\mathbf{1}$ | $\mathbf{1}$ | $\mathbf{0}$ | $\mathbf{1}$ |

$$
16+8+4+1=29
$$

## Adding Binary

## Rules

$0+0=0$
$0+1=1$
$1+0=0$
$1+1=10$ ( 0 then carry the 1 )
$1+0+0=1$
$1+1+1=11$ ( 1 then carry the 1 )

## Example:

## Algorithms Starter

- Algorithms are sets of step-by-step instructions for the computer to follow. They are at the heart of all computer programs.
- To make a program, in your algorithm you must specify:
>input
$>$ process
This is the success criteria.

## Flow charts

| Start or Stop | Start/Stop | The beginning and end points in the sequence. | Input or output | Input/Output | An input is data received by a computer. An output is a signal or data sent from a computer. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Process | Process | An instruction or a command. | Connector |  | A jump from one point in the sequence to another. |
| Decision |  | A decision, either yes or no. For example, a decision based on temperature that turns a central heating system on or off. | Direction of flow |  | Connects the symbols. The arrow indicates direction. |

## Flowchart Example

A selection is used to make choices based on information.
An algorithm can be made more intelligent by using IF, THEN and ELSE to repeat instructions or move to different parts of the program.

The algorithm about entering the room could be changed to account for different conditions. For instance, it could change to:

1. IF the door is locked, THEN unlock the door, ELSE do nothing (go to next instruction)
2. IF the door is closed, THEN open the door, ELSE do nothing
3. Enter the room
4. IF the room is dark, THEN switch on the light, ELSE do nothing
5. Close the door behind you
